

Only domains with a converged FOM reference

What the current RVE does not establish

Outward Free-only scan:
first sampled negative curvature = -3.43 MPa
at ring factor 1.55, $\det F = 0.780$

FOM check:
Newton loses convergence on the
current FOM continuation branch
before reaching this state.

Therefore this is an OOD warning,
not an FOM-confirmed Free failure.
